# Apply filters to SQL queries

### Project description

I recently discovered a potential security incident that occurred during non-working hours, and therefore my job as a Security Analyst is to access databases using SQL language, do the following:

### Retrieve after hours failed login attempts

With this code we can find out when there have been login attempts outside of business hours that have failed.

```
MariaDB [organization] > SELECT *
    -> FROM log in attempts
    -> WHERE login time > '18:00' AND NOT success = '1';
 event_id |
                                      login_time
                                                             ip_address
            username | login_date
                                                   country
                                                                               success
         2

                                                   MEXICO
                                                                                      0
```

Here, my query works in such a way that I request all possible data, in the first line, from a specific page, which is indicated in the second, but here, my most important task is to filter the data so that it is correct for the current task, this is exactly I'm demonstrating here.

```
-> WHERE login time > '18:00' AND NOT success = '1';
```

Here, we can see that the column called "login\_time" is adjusted for non-working hours, which removes all the results that we do not need, and it will also show all unsuccessful attempts, since the command "NOT success = '1" indicates that in the response We were not shown all the attempts that were successful.

## Retrieve login attempts on specific dates

Using this code we reference specific dates on which the incident is known to have occurred, we ask the database to provide us with information about after-hours login attempts to find out more information about the incident.

ariaDB [organization]> SELECT * -> FROM log_in_attempts -> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';						
event_id	username	   login_date	login_time	country	ip_address	+   success

61	dtanaka	2022-05-09	09:45:18	USA	192.168.98.221	i 1 i

Here we can see how in the third line of code I use filtering on the "login\_date" column, since the incident took place at a certain designated time, we are interested in the specific dates that I specified in the third line.

## Retrieve login attempts outside of Mexico

The team recorded that the suspicious activity in the company was definitely not from Mexico, so we will exclude this country from the filter of the data we are interested in:

```
MariaDB [organization]> SELECT *
   -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
                        login date
 event id

```

Here, in the third line, we can see that I used the "NOT" command to filter and also used the "LIKE" command to filter similar values, which can be designated for example as "MEX", which also means that suspicious traffic was detected not from there.

## Retrieve employees in Marketing

Since my team wants to analyze all the data in the marketing office of the east office:

```
MariaDB [organization] > SELECT *
    -> FROM employees
    -> WHERE department = 'Marketing' AND office LIKE 'East%';
                                                         office
  employee id
                device id
                                           department
                                username
         1000 |

                                                     West-280
```

After completing the task, I selected all the data using the "SELECT \*" command from the "employees" database, after which I filtered the data in such a way that only those devices that are in the "Finance" and "Sales" department were displayed there, which is what we need, we can see this in the third line. WHERE is responsible for filtering, "department = 'Finance' OR department = 'Sales" means that we are only interested in those systems that are located in the finance and sales department, the display of which we see in the image.

#### Retrieve all employees not in IT

The next task, our team was tasked with updating all systems except the IT department, for this we must identify all systems that are not IT systems.

```
MariaDB [organization] > SELECT *
    -> FROM employees
    -> WHERE NOT department = "Information Technology";
  employee id | device id
                                                          | office

```

Here we can see that with the help of the first two lines of code, we access the database we are interested in, after which in the third line we set up filtering so that all systems except IT are displayed to us, the NOT command in this case is responsible for excluding all non-IT systems. systems of interest to us,

and "department = 'Information Technology" demonstrates systems from which particular department we are not interested in.

## Summary

Thus, we can see what a primary role filtering plays in my work, and how flexibly and efficiently these commands can be used to perform important tasks.
